

Data Exploration and Preprocessing Report

Project: Global AI Adoption in Education

Date	26 September 2026
Team ID	Not provided
Project Title	Global AI Adoption in Education
Dashboard Source	Tableau Public dashboard shown in the provided screenshot

Section	Description / Work for the Project
Data Overview	The dashboard represents Global AI Adoption in Education. The visible analysis includes region-wise school AI adoption, daily AI usage, school AI adoption percentage, internet penetration, rural AI usage, year-wise trends, and geographic patterns.
Data Cleaning	Before analysis, the dataset should be checked for missing values, duplicate records, inconsistent entries, spelling errors, and invalid values. Any such issues should be resolved before creating the dashboard.
Data Transformation	The dashboard uses transformed views such as filtering/grouping by region, year-wise trend analysis, comparative regional views, and calculated/aggregated measures for AI adoption and usage.
Data Type Conversion	Fields should use appropriate data types: Year as a numeric/date field, region as a categorical field, and adoption/usage measures as numeric values so that Tableau can calculate and visualize them correctly.
Column Splitting and Merging	Columns should be split or merged only where required for analysis. The dashboard screenshot does not show a specific column-splitting requirement.
Data Modeling	The dashboard presents multiple measures and dimensions together, including Region and Year with AI adoption/usage measures. No separate-table relationship is visible in the supplied screenshot.
Save Processed Data	After cleaning and transformation, the processed dataset should be saved so the Tableau workbook/dashboard can be refreshed and reused consistently.

Note: The report is prepared from the supplied Data Exploration and Preprocessing template and the visible Tableau dashboard screenshot. Where the screenshot does not provide a specific preprocessing detail, the report states the appropriate check/process rather than inventing dataset values.
